

IR-12 / IR-24

MULTICHANNEL POWER CONTROLLER

Main Applications

- Welding of composites and plastics
- Preheating on Blow Molding lines
- Thermoforming
- Multichannel applications with infrared lamps

Main Characteristics

- 12 and 24 independent 9A channels
- Fast Zero-Crossing, Half-Single-Cycle and Phase-Angle control
- · Built-in extra-rapid fuses
- · Current balancing with time-sharing
- · Voltage swing compensation
- Voltage and current diagnostics (interrupted load, line voltage)
- Diagnostics of SCR temperature, SCR short circuit, open fuse
- · Modbus and Profinet communication

PROFILE

Powerful and compact IR12 and IR24 Multichannel Power Controllers are the ideal solution for heating systems that use any type of infrared lamps.

With an "all-in-one" philosophy, all of the elements needed for complete control of IR lamp groups (for total power up to 60 kW) are contained in a robust, compact metal container that mounts on the wall.

There are various models: IR-24 with 24 independent control output and IR-12 with 12 outputs, both with Modbus RTU or Profinet Fieldbus communication options.

COMMAND

The 12 or 24 channels are commanded via Modbus RTU serial communication (max 57,600bps) or via Profinet.

Each channel is commanded independently.

Power

Each control output can deliver a maximum current of 9A, including simultaneously on all channels, up to 216 Amps for IR24 models.

CONTROL

The Soft-start function, provided in Phase Angle mode, guarantees gradual initial heating of lamps, reduces current spikes, and lengthens life cycle. After the Soft-start phase, when the filament is hot, the lamp can be controlled in "Burst Firing" or "Half Single Cycle" mode.

Complete Phase Angle control can always be chosen. In detail, the control modes, configurable via SW, are:

BF: Burst Firing

Zero crossing with optimized cycle time: ideal for fast heating systems with mediumwave IR lamps.

HSC: Half Single Cycle

Zero crossing similar to BF, but able to control half-waves, making it perfect for short wave lamps as well because it greatly limits flickering without generating EMC noise; therefore, expensive and bulky EMC filters are not needed.

PA: Phase angle

Modulating the conduction angle of each wave allows more precise and stable control of IR lamps.

TIME SHARING

Continuous monitoring of power percentages on outputs allows intelligent "timesharing" distribution of outputs and provides continuous balancing of total instantaneous current levels on each of the three phases. This reduces spikes, increases the system's power factor, and saves energy.

LINE VOLTAGE COMPENSATION

Automatic compensation ensures correct power to loads even in the presence of voltage swings.

DIAGNOSTICS

Great attention is given to general and specific diagnostic functions for every output, with signal LEDs and specific diagnostic bits readable from serial and Fieldbus.

- Current Diagnostics: Total load interrupt alarm
 - SCR short circuit alarm
- Voltage Diagnostics:
- Alarm for absence of phase - Fuse Diagnostics
- Fuse break signal (for each output)Temperature Diagnostics
- Alarm for over-temperature of power module

The IR-24 and IR-12 Controllers are completely configurable via GF_ eXpress, Gefran's powerful SW configuration tool for all of its devices.

GENERAL DESCRIPTION

5. Modbus serial connector

10.Cooling fan unit

GENERAL DESCRIPTION

- 1. Diagnostics Leds
- 2. Ethernet port ETH0, ETH1
- 3. I/O LEDs
- 4. Ethernet port ETH0, ETH1 status Leds indication
- 5. I/O connector

- 6. CPU power supply (230VAC)
- 7. Line power terminals 400-480VAC (3F + N, Earth)
- 8. Fuse holders with protection fuses (24 for IR24, 12 for IR12)
- 9. Output connectors (to load)
- 10.Cooling fan unit
